Calculating BBST scores with R

Naming the files
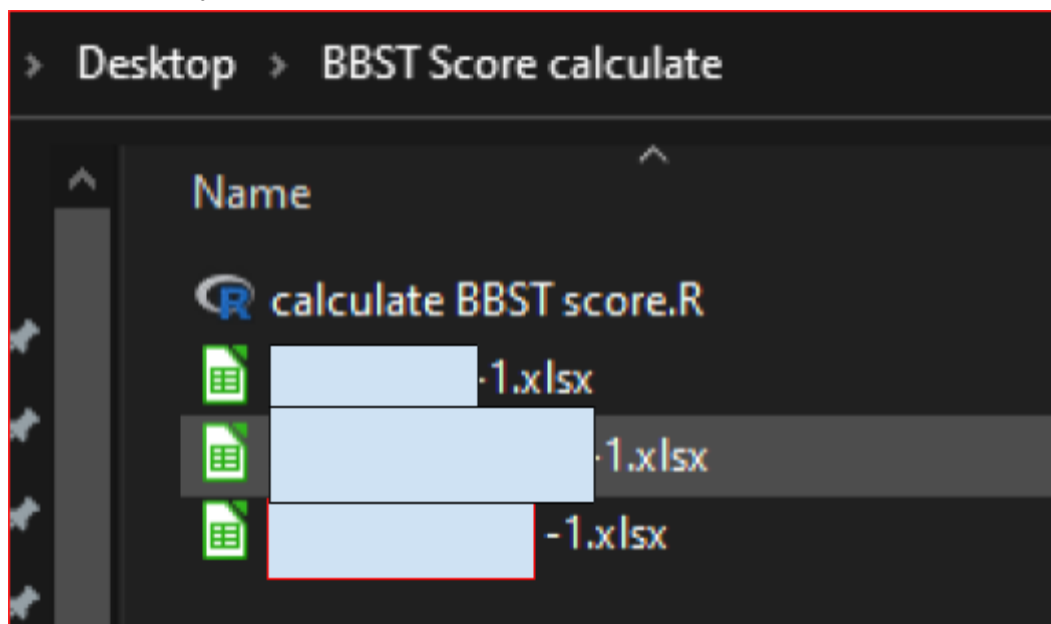

1. **Make sure the files** are named as below, with "Name" as the full name of the subject

| Paradigm player data |
| --- |
| Name**-1.xlsx** |

2. Make a folder containing all of the paradigm files (ends in .xlsx) you want and named appropriately as in step 1.
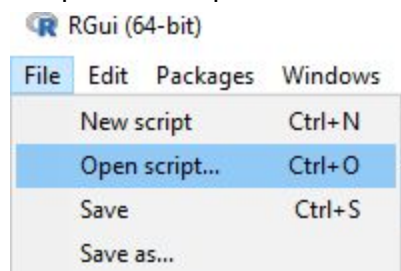

3. Copy the R script into the folder

4. This is what your folder should look like

5. Open RGui, and go to File -> Change dir -> and select the folder you just made in step 4.

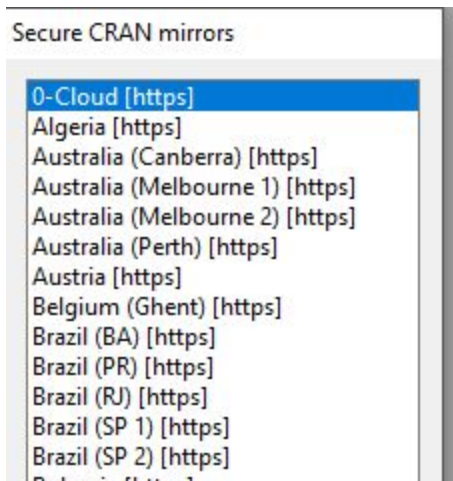

6. Open the script in R in the folder you made in step 4

7. Select all the code in the script and then right click → Run line or selection

- **Press ok when/if the screen below pops up and allow time for packages to install. The rest of the script will run automatically**
  - **If it doesn't pop up then you already have the packages installed.**

Secure CRAN mirrors
